Abstract

Analysis of microbial data from archaeological samples is a growing field with great potential for understanding ancient environments, lifestyles, and diseases. However, high error rates have been a challenge in ancient metagenomics, and the availability of computational frameworks that meet the demands of the field is limited. Here, we propose aMeta, an accurate metagenomic profiling workflow for ancient DNA designed to minimize the amount of false discoveries and computer memory requirements. Using simulated data, we benchmark aMeta against a current state-of-the-art workflow and demonstrate its superiority in microbial detection and authentication, as well as substantially lower usage of computer memory.

Keywords: Ancient metagenomics, Pathogen detection, Microbiome profiling, Ancient DNA

Background

Historically, ancient DNA (aDNA) studies have focused on human and faunal evolution and demography, extracting and analyzing predominantly eukaryotic aDNA [1–3]. With the development of next-generation sequencing (NGS) technologies, it was demonstrated that host-associated microbial aDNA from eukaryotic remains, which was previously treated as a sequencing by-product, can provide valuable information about ancient pandemics, lifestyle, and population migrations in the past [4–6]. Modern technologies have made it possible to study not only ancient microbiomes populating eukaryotic hosts, but also sedimentary ancient DNA (sedaDNA), which has rapidly become an independent branch of palaeogenetics, delivering unprecedented information about hominin and animal evolution without the need to analyze historical bones and teeth [7–12]. Previously available in microbial ecology, meta-barcoding methods lack validation and authentication power, and therefore, shotgun metagenomics has become the *de facto* standard in ancient microbiome research [13]. However, accurate detection,

aMeta: an accurate and memory-efficient ancient Metagenomic profiling workflow

snakemake 6.10.0 Tests

About

aMeta is a Snakemake workflow for identifying microbial sequences in ancient DNA shotgun metagenomics samples. The workflow performs:

- trimming adapter sequences and removing reads shorter than 30 bp with Cutadapt
- quality control before and after trimming with FastQC and MultiQC
- taxonomic sequence kmer-based classification with KrakenUniq
- sequence alignment with Bowtie2 and screening for common microbial pathogens
- deamination pattern analysis with MapDamage2
- Lowest Common Ancestor (LCA) sequence alignment with Malt
- authentication and validation of identified microbial species with MaltExtract

When using aMeta and / or pre-built databases provided together with the workflow for your research projects, please cite our preprint: <https://www.biorxiv.org/content/10.1101/2022.10.03.510579v1>

- Expectations from the course

Typical analysis methods used in ancient metagenomics

1) Alignment:

2) Classification:

Centrifuge

MetaPhlan

Clark

Reference based:
assume similarity to reference

3) De-novo assembly:

Reference free:
unbiased but challenging

Course outline

Day 1: introduction to ancient microbial and environmental metagenomics, quality control, adapter removal, taxonomic profiling

Day2: alignment, accessing mapping quality, decontamination, source tracking and authentication analyses

Day3: aMeta workflow, *de novo* assembly and authentication of assembled contigs

- To ask questions please **raise your hand, unmute yourself and ask**. You can also ask questions in the **zoom chat** or the **slack channel** for this course.
- I would greatly appreciate if you **keep your camera on** as much as possible for better contact and communication.
- The course includes **7 lectures (~1h each) and 7 practicals (~1.5h each)**, there is a **15 min break** after each lecture and each practical
- During practicals, we will use **bash command line tools**. At the end of each practical, I will go through command lines with my explanations.
- The course assumes **some familiarity with basics of bash / R / Python / aDNA**, you do not have to be fluent though. In case any terminology is unclear, please ask, I am ready to provide more detailed explanations.

Practical information: GitHub and Zoom

The course will take place in Zoom from 2 pm to 8 pm (CET, Berlin time)

Links to the Zoom room will be posted in the Slack channel

Practical information: Amazon Cloud (AWS EC2)

We will use the Cloud Computing service from Amazon, which we will access via `ssh` (secure shell protocol)

```
ssh -i ameta.pem -X ubuntu@54.244.40.220
```

- The IP address changes every day
- Everyone is given a username, with a `home` and `shared` folders
 - List of usernames can be found in Slack
 - The `shared` folder is copy-only: do not delete, move, rename, or write
